

RedHand

application description

Saving a life by donating blood has never been so easier. All you need is your wish to help others, the rest RedHand app will handle.

As the name itself implies, RedHand is a mobile application offering a helping hand to those in need of blood. The application presents a unique and convenient approach of connecting people that need blood transfusion with the ones willing to voluntarily donate blood.

To get started, upon opening the application, one has to enter their necessary information – name, birth date, blood type, email and phone number and current address. With this single step the user is being registered in the database and receives a user ID with the information they provided. Once a request is placed from a hospital or blood bank with the urgent need for blood donating, all the users with the certain blood type and the certain location receive a push notification on their device. Besides this, the app provides the users with the ability to share the request for blood on different social networks so they raise more people's attention and eventually they become donors too. The application tracks user's activity and keeps a history of older notifications received.

The application is a promise to address the shortage of blood supply and help people in need.

For the welcome page screenshot:

1st variant: RedHand is a mobile application connecting people in need of blood transfusion with the ones willing to help and donate blood.

2nd variant: RedHand is a mobile app offering a helping hand to those in need of blood transfusion by connecting them with volunteer donors
